

# Robots!

Robots! is a multi-round, completely autonomous game played by two robots taking turns moving across a 7x7 game board in search of a randomly placed prize token.

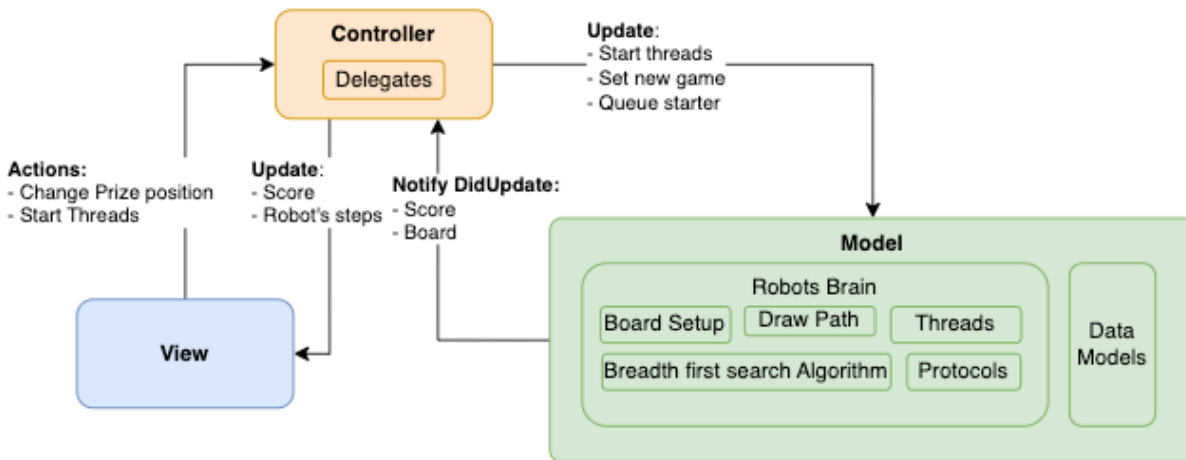

## 1. Used Stack and Concepts

- UIKit
- Swift
- Protocols and delegates
- MVC
- Threads and Grand Central Dispatch
- Graphs, nodes, and queues
- Breadth First Search Algorithm
- XCTest and UITest

## 2. Bonus

You can change the target by tapping one of the available nodes, so the robots change the path and try to reach the new goal.

### 3. Architecture

### 4. Breadth First Search Algorithm

A dungeon has a board size of  $R \times C$  and you start at cell '0,0' and there's an exit at cell '4,3'. Blockers are indicated by a '#' and empty cells are represented by a '.'.

Start at the start node coordinate by adding (sr, sc) to the queue:

	0	1	2	3	4	5	6
0	(0,0)	.	.	#	.	.	.
1	.	#	.	.	.	#	.
2	.	#	.	.	.	.	.
3	.	.	#	#	.	.	.
4	#	.	#	E	.	#	.

(0, 0)

Keep adding to the queue:

	0	1	2	3	4	5	6
0	(0,0)	(0,1)	(0,2)	#	.	.	.
1	(1,0)	#	.	.	.	#	.
2	(2,0)	#	.	.	.	.	.
3	.	.	#	#	.	.	.
4	#	.	#	E	.	#	.

(2, 0)  
(0, 2)  
(1, 0)  
(0, 1)  
(0, 0)

	0	1	2	3	4	5	6
0	(0,0)	(0,1)	.	#	.	.	.
1	(1,0)	#	.	.	.	#	.
2	.	#	.	.	.	.	.
3	.	.	#	#	.	.	.
4	#	.	#	E	.	#	.

(1, 0)
(0, 1)
(0, 0)

We have reached the end, and if we had a 2D prev matrix we could regenerate the path by retracing our steps:

	0	1	2	3	4	5	6
0	(0,0)	(0,1)	(0,2)	#	(0,4)	(0,5)	(0,6)
1	(1,0)	#	(1,2)	(1,3)	(1,4)	#	(1,6)
2	(2,0)	#	(2,2)	(2,3)	(2,4)	(2,5)	(2,6)
3	(3,0)	(3,1)	#	#	(3,4)	(3,5)	(3,6)
4	#	(4,1)	#	(4,3)	(4,4)	#	.
